Analysis of variance for combining ability revealed that variances due to gca and sca were significant for all the traits except for TSS that exhibited non-significant mean squares for gca and sca in environment E₁ only suggesting the importance of both types of variances in the inheritance of the traits. GCA and SCA also interacted significantly with the environments. The estimates of dominance variance were higher in magnitude than corresponding estimates of additive variance indicating the preponderance of non-additive gene action. None of the parents exhibited desirable gca effects for all the traits simultaneously. The overall ranking of genotypes revealed that the parents Pusa Purple Long, GBL-1, Arka Nidhi, SBW-11, Pusa Purple Cluster and Local Long exhibited significant desirable gca effects for most of the traits. None of the crosses exhibited significant desirable sca effects for all the traits simultaneously. However, the crosses Arka Kusumakar x Local Long, GBL-1 x Pusa Purple Long, Arka Nidhi x GOB-1, Arka Nidhi x Pusa Kranti and SBPL-27 x GOB-1 were found to be desirable for most of the traits.

Introduction

Brinjal (*Solanum melongena* L.) is one of the major and principle vegetable crops widely grown in both temperate and tropical regions of the globe. In India, it is cultivated over an area of 691.50 thousand hectares with an annual production of 12634.10 thousand tonnes and productivity of 18.30 tonnes hectare⁻¹ (Tiwari *et al.*, 2012) while in Jammu and Kashmir, it occupies an area of 1.95 thousand hectares with an annual production of 38.13 thousand tonnes and productivity of 19.53 tonnes hectare⁻¹ (Anonymous, 2011). In

J&K state in general and Kashmir valley in particular only few cultivars of brinjal are available for commercial cultivation which are either poor yielders and/or susceptible to various biotic and abiotic stresses. In the face of increasing population, there is a need for increasing its production and productivity levels. Its diversification, off-season production, availability of diverse types and development of potential hybrids has resulted in change of local preferences. In view of changing local preference for colour, shape,

taste, etc., it is not possible to have one common cultivar to suit different localities of a region and local preferences. It is, therefore, necessary to improve the locally preferred cultivars or develop new hybrid combinations for high yield, quality, consumer acceptability and meet diverse taste of locals. This necessitates the development of varieties/hybrids superior in yield and quality. However, due to continued selection, much of the variability has exhausted. In order to create variability and identify the desirable segregants, emphasis needs to be laid on hybridization between the parents. Before any such improvement programme is initiated through hybridization, there is a need to have knowledge on combining ability of different genotypes and the nature and magnitude of various genetic parameters operative in different characters. Several biometrical procedures are available for evaluation of parents and their crosses for their general and specific combining ability and to know the nature and magnitude of gene effects for expression of various metric traits. Diallel analysis as suggested (Griffing, 1956a,b) helps to generate basic information on nature of inheritance of traits and to assess the combining ability of parents. The information generated on general and specific combining ability can be effectively used to identify superior varieties to be used as parents for hybridization and also indicate cross combinations likely to yield desirable segregates.

Materials and Methods

The present investigation was carried out to study general and specific combining ability of parents and crosses, respectively. The experimental materials for the present investigation consisted of ten diverse parental lines viz., Pusa Purple Cluster, Arka Nidhi, Pusa Kranti, SBPL-27, Arka Kusumakar, SBW-11, GBL-1, GOB-1, Pusa Purple Long and Local Long crossed in a diallel fashion

during *Kharif* 2011 and 45 cross combinations were generated as per method II and Model-I (Griffing, 1956a,b). The parents and F₁ crosses were evaluated during *Kharif* 2012 in randomized complete block design with three replications at each of the three different locations viz., Vegetable Experimental Farm, Division of Vegetable Science, SKUAST-Kashmir, Shalimar (E₁), Regional Research Station and Faculty of Agriculture, Wadura (E₂) and Mountain Research Center for Field Crops, Khudwani, Anantnag (E₃). The observations were recorded on days to first flowering, days to first fruit set, days to first fruit picking, plant height (cm), plant spread (cm), number of branches plant⁻¹, fruit length (cm), fruit diameter (cm), number of pickings plant⁻¹, number of fruits plant⁻¹, average fruit weight (g), fruit yield plant⁻¹ (kg), fruit yield (q ha⁻¹), dry matter (%), TSS (°Brix), vitamin C (mg 100g⁻¹), anthocyanin (mg 100 g⁻¹), total phenols (mg 100 g⁻¹). The data thus generated, was subjected to standard statistical procedures to generate the results.

Results and Discussion

Analysis of variance for general and specific combining ability and their interactions with environment and estimates of components of variance are presented in table 1a and 1b. Analysis of variance for combining ability revealed that the mean squares due to environments were significant for all traits under consideration revealing that the environments chosen for the present investigation were diverse. Mean squares for general and specific combining ability were also significant for all traits under study in the pooled analysis. The mean squares due to gca x environment and sca x environment were found significant for all the traits. Variances due to sca ($\hat{\sigma}^2$ s) were higher in magnitude than the corresponding gca variances ($\hat{\sigma}^2$ g) for all the traits under consideration

indicating the greater role of non-additive gene effects. The magnitude of dominance variance was found to be higher than the corresponding additive variance for all the traits again indicating the importance of non-additive gene action. The ratio of additive genetic variance to dominance variance ($\hat{\sigma}^2 A / \hat{\sigma}^2 D$) was less than unity for all the traits. Preponderance of non-additive gene action for various traits studied has also been reported (Chaudhary, 1999; Das and Barua, 2001; Singh *et al.*, 2002a); Biradar *et al.*, 2005; Suneetha and Kathiria, 2006; Quamruzzaman *et al.*, 2007; Karibasava *et al.*, 2010; Muniappan *et al.*, 2010; Nalini *et al.*, 2011; Rai and Asati, 2011; Hubaity and Teli, 2013; Raghvendra *et al.*, 2014; Reddy and Patel, 2014; Sharif Uddin *et al.*, 2015).

None of the parents possessed significant and desirable general combining ability effects for all the traits simultaneously. However, different parents were found to reveal desirable general combining ability for different trait (Table 2a and 2b).

Arka Nidhi, SBW-11 and GBL-1 showed significant negative gca effects for maturity traits viz., days to first flowering, days to first fruit set and days to first fruit picking in all the environments and pooled analysis except Arka Nidhi in days to first flowering. The desirable combiners were Local Long, Arka Nidhi and Arka Kusumkar for plant height; Arka Nidhi, SBPL-27, Arka Kusumaker, Pusa Purple Long and Local Long for plant spread; Arka Kusumaker, GBL-1 and Pusa Purple Long for number of branches plant⁻¹; Arka Nidhi, Arka Kusumaker, GBL-1, Pusa Purple Long and Local Long for fruit length and Pusa Kranti and GOB-1 for fruit diameter. Desirable gca effects were also depicted by SBW-11, GOB-1, Pusa Purple Long and Local Long for average fruit weight; Pusa Purple Cluster, Arka Nidhi, SBPL-27, GBL-1 and Pusa Purple Long for number of fruits

plant⁻¹ and Arka Kusumaker, SBW-11, GBL-1 and PPL for number of pickings plant⁻¹; Pusa Purple Cluster, GBL-1, PPL and L. Long for fruit yield plant⁻¹. GBL-1 and GOB-1 showed significant positive effect for dry matter content while most of the parent's viz., SBPL-27, Arka Kusumaker, SBW-11, GBL-1, GOB-1 and Local Long exhibited non-significant gca effects for TSS in all individual environments and pooled analysis. Pusa Purple Long exhibited significant positive gca effect in all individual environments and pooled analysis where it exhibited non-significant gca effect; Pusa Purple Cluster exhibited significant positive gca effect in pooled analysis while non-significant gca effect. Arka Nidhi and Pusa Kranti were found to be good combiners for vitamin C; Arka Nidhi, Pusa Kranti, GBL-1, GOB-1 for anthocyanin and SBPL-27, Arka Kusumaker, SBW-11, GOB-1, Pusa Purple Long and Local Long were found to be good combiners with significant positive gca effect for total phenols in individual environments and data pooled over environments. In most of the cases, high general combining ability for the traits was associated with their high to average *per se* performance and poor general combining ability was associated with low *per se* performance.

None of the parents exhibited superior general combining ability for all the traits simultaneously. However, overall ranking of genotypes revealed that the parents PPL, GBL-1, A. Nidhi, SBW-11, PPC and L. Long exhibited significant desirable gca effects for most of the traits. Similar results were obtained (Chaudhary, 1999; Das and Barua, 2001; Singh *et al.*, 2002a; Biradar *et al.*, 2005; Suneetha and Kathiria, 2006; Quamruzzaman *et al.*, 2007; Karibasava *et al.*, 2010; Muniappan *et al.*, 2010; Nalini *et al.*, 2011; Rai and Asati, 2011; Hubaity and Teli, 2013; Raghvendra *et al.*, 2014; Reddy and Patel, 2014; Sharif Uddin *et al.*, 2015).

*, ** Significant at 5 and 1 per cent levels, respectively

The specific combining ability of forty five crosses for different traits revealed that none of the F_1 crosses exhibited significant desirable effects for all the traits. Performance of some excellent crosses on the basis of SCA and *per se* performance together with the parental performance for each trait is given in table 3a and 3b. The crosses exhibiting significant desirable SCA effects (pooled over environments) included PPC x A. Nidhi, PPC x A. Kusmakar, PPC x SBW-11, PPC x L. Long, A. Nidhi x SBPL-27, A. Nidhi x GOB-1, P. Long, GOB-1 x PPL for fruit yield; Pusa Purple Cluster x SBPL-27, Pusa Purple Cluster x SBW-11, PPC x GBL-1, PPC x PPL, PPC x L. Long, A. Nidhi x P.Kranti, A. Nidhi x A. Kusumakar, A. Nidhi x GBL-1, P.Kranti x A. Kusumakar, P.Kranti x GOB-1, SBPL-27 x GOB-1, SBPL-27 x PPL, SBPL-27 x L.Long, A. Kusumakar x SBW-11, A.Kusumakar x L.Long, GBL-1 x GOB-1, GBL-1 x L.Long and GOB-1 x PPL for dry matter; A.Nidhi x GOB-1, SBPL-27 x L.Long and A.Kusumakar x GBL-1 for TSS; A.Nidhi x P.Kranti, A.Nidhi x GBL-1, A.Nidhi x GOB-1, P.Kranti x L.Long, SBPL-27 x GBL-1 and A.Kusumakar x L.Long for vitamin C; PPC x A.Kusumakar, Pusa Purple Cluster x SBW-11, PPC x GOB-1, A.Nidhi x SBW-11, A.Nidhi x GOB-1, A.Nidhi x PPL, A.Nidhi x L.Long, P.Kranti x SBPL-27, P.Kranti x A.Kusumakar, P.Kranti x GBL-1, P.Kranti x L.Long, SBPL-27 x GBL-1, A.Kusumakar x

PPL, GBL-1 x GOB-1, GBL-1 x PPL and PPL x L.Long for anthocyanin and PPC x A.Nidhi, Pusa Purple Cluster x GBL-1, PPC x GOB-1, Pusa Purple Cluster x Pusa Purple Long, A.Nidhi x SBW-11, A.Nidhi x GBL-1, A.Nidhi x GOB-1, A.Nidhi x PPL, A.Nidhi x L.Long, P.Kranti x SBPL-27, P.Kranti x A.Kusumakar, P.Kranti x SBW-11, P.Kranti x GBL-1, P.Kranti x GOB-1, P.Kranti x PPL, P.Kranti x L. Long, SBPL-27 x GBL-1, SBPL-27 x GOB-1, SBPL-27 x PPL, SBPL-27 x L. Long, A.Kusumakar x GBL-1, A.Kusumakar x PPL, A.Kusumakar x L. Long, SBW-11 x GOB-1, SBW-11 x PPL, SBW-11 x L. Long, GBL-1 x GOB-1, GOB-1 x L. Long and PPL x L. Long for total phenols. None of the crosses exhibited significant desirable sca effects for all the traits simultaneously. However, the crosses A.Kusumakar x L.Long, GBL-1 x PPL, A.Nidhi x GOB-1, A.Nidhi x P.Kranti and SBPL-27 x GOB-1 were found to be desirable for most of the traits. These desirable specific cross combinations resulted out of crosses between the parents with high x low followed by low x low, high x high and average x low general combining ability. Similar results for various characters in brinjal were also reported (Chaudhary, 1999; Das and Barua, 2001; Singh *et al.*, 2002a; Biradar *et al.*, 2005; Suneetha and Kathiria, 2006; Quamruzzaman *et al.*, 2007; Karibasava *et al.*, 2010; Muniappan *et al.*, 2010; Nalini *et al.*, 2011; Rai and Asati, 2011; Hubaity and Teli, 2013; Raghvendra *et al.*, 2014; Reddy and Patel, 2014; Sharif Uddin *et al.*, 2015).

The overall ranking of genotypes revealed that the parents Pusa Purple Long, GBL-1, Arka Nidhi, SBW-11, Pusa Purple Cluster and Local Long exhibited significant desirable gca effects for most of the traits. None of the crosses exhibited significant desirable sca effects for all the traits simultaneously. However, the crosses Arka

Kusumakar x Local Long, GBL-1 x Pusa Purple Long, Arka Nidhi x GOB-1, Arka Nidhi x Pusa Kranti and SBPL-27 x GOB-1 were found to be desirable for most of the traits.
